

Diffusion — probability-flow ODE
curved paths → small steps
35 model evaluations

Flow matching — straight-path ODE
near-straight paths → big steps
10 model evaluations

MeanFlow — average velocity
the jump is the model output
1 model evaluation

● start: shared prior samples ● end after 35 steps ● end after 10 steps ● end after 1 jump

Analytic 2-D toy: exact score / exact flow-matching velocity of a 3-component Gaussian mixture — no trained networks. Same 80 prior samples in every panel; Euler integration; the MeanFlow jump is the exact flow map (fine reference integration of the same field).
